TxID	581057
ToLID	<b>kaBotViol</b>
Species	Botrylloides violaceus
Class	Ascidacea
Order	Stolidobranchia

Genome Traits	Expected	Observed
Haploid size (bp)	139,513,824	130,369,453
Haploid Number	16 (source: ancestor)	16
Ploidy	2 (source: ancestor)	2
Sample Sex	unknown	unknown

## EBP metrics summary and curation notes

Obtained EBP quality metric for pri: 6.6.Q39

The following metrics were automatically flagged as below EBP recommended standards or different from expected:

- . QV value is less than 40 for pri
- . Kmer completeness value is less than 90 for pri
- . Assembly length loss > 3% for pri

### Curator notes

- . Interventions/Gb: 93
- . Contamination notes: "30 sequences were removed as contaminants. In addition, 2 large scaffolds (SUPER\_6, SUPER\_7) were classified as Mollusca. However, they were not removed because their coverage and GC content were consistent with the rest of the genome, and they showed no Hi-C contacts with other scaffolds."
- . Other observations: "The assembly of species Botrylloides violaceus is based on 1493x long read ONT data and 1085x Arima HiC data generated as part of the ERGA initiative via the BGE project. The assembly process included the following steps: ONT reads shorter than 3 kb were filtered out, thus the remaining reads for a total of ~215 Gb were assembled using Necat with polishing performed using NextPolish. Contigs were subsequently filtered with purge\_dups. Scaffolding was performed by aligning HiC reads to the purged contigs using the Omni-C mapping pipeline, followed by YaHS for scaffold construction. Contamination was checked using BlobTools. The scaffolds were processed through sanger\_tol/curationpretext pipeline to generate the contact map, which was manually improved using PretextView. The presence of a mitochondrial genome contig/scaffold was not assessed. Chromosome-scale scaffolds confirmed by HiC data were named in order of size."
